The listing of claims will replace all prior versions, and listings, of claims

in the application:

Listing of Claims:

1-12 (Cancelled).

13. (Currently Amended) A pressure regulator module for a vehicle

pneumatic braking system for a wheel-slip-dependent controlling or regulating of

braking pressures applied to two separate working connections, the pressure

regulator module comprising:

a two-way valve assembly having two conduits, including one relay valve,

respectively, for each conduit, each relay valve having a control input;

wherein, a respective solenoid control valve in the form of a 3/2-way valve

having two switching positions is assigned to the control input of each relay

valve without inserting additional valves;

wherein the solenoid control valves, together with only one additional

inserted solenoid control valve coupled on an input side of the module, connect

the control input of the respective relay valve with at least one of a bleeding

system, a control pressure, and a compressed-air reservoir;

Attorney Docket No. 037068.55856US

wherein the inserted solenoid control valve connects the control input of

the respective relay valve with the compressed air reservoir for adapting the

speed of rotation of a driven wheel, which initially slips during acceleration, to

the speed of rotation of a non-slipping wheel, and the solenoid control valve

assigned to a slipping wheel is controlled in a timed manner depending on the

slip rate of the slipping wheel and a change in velocity of said slipping wheel,

whereby the solenoid control valve assigned to the slipping wheel is alternatively

switched back and forth between a pressure buildup position and a pressure

reduction position.

14. (Previously Presented) The pressure regulator module according to

Claim 13, wherein the solenoid control valves are controlled independently of one

another by an electronic controlling and regulating unit, and are connected on

the input side with the control pressure and on an output side, in each case, with

the control input of the assigned relay valve and with the bleeding system.

15. (Previously Presented) The pressure regulator module according to

Claim 14, wherein in a non-energized spring-loaded normal position, the solenoid

control valves switch the control pressure through to the control inputs of the

relay valves and, in an energized position, switch the control inputs of the relay

valves through to the bleeding system.

16. (Currently Amended) The pressure regulator module according to

Claim 15, wherein, for holding the pressure at the working connection of a

respective conduit the conduits, the assigned solenoid control valve is

alternatingly switched back and forth in a pressure buildup position and a

pressure reduction position by the controlling and regulating unit.

17. (Previously Presented) The pressure regulator module according to

Claim 14, wherein the only one additional solenoid control valve is formed by an

additional 3/2-way valve, which is controlled by the electronic controlling and

regulating unit and which is connected on the input side with the control

pressure and with the compressed-air reservoir, and on the output side with

inputs of the two solenoid control valves.

18. (Previously Presented) The pressure regulator module according to

Claim 15, wherein the only one additional solenoid control valve is formed by an

additional 3/2-way valve, which is controlled by the electronic controlling and

regulating unit and which is connected on the input side with the control

pressure and with the compressed-air reservoir, and on the output side with

inputs of the two solenoid control valves.

Attorney Docket No. 037068.55856US

19. (Previously Presented) The pressure regulator module according to

Claim 16, wherein the only one additional solenoid control valve is formed by an

additional 3/2-way valve, which is controlled by the electronic controlling and

regulating unit and which is connected on the input side with the control

pressure and with the compressed-air reservoir, and on the output side with

inputs of the two solenoid control valves.

20. (Previously Presented) The pressure regulator module according to

Claim 17, wherein, in a non-energized spring-loaded normal position, the only

one additional solenoid control valve switches the control pressure through to the

inputs of the two solenoid control valves, and in an energized position, switches

inputs of the two solenoid control valves through to the compressed-air reservoir.

21. (Previously Presented) The pressure regulator module according to

Claim 20, wherein the only one additional solenoid control valve is operated

independently of the control pressure and as a function of a wheel slip occurring

during an acceleration or of a lateral acceleration.

22. (Previously Presented) The pressure regulator module according to

Claim 21, wherein the only one additional solenoid control valve is integrated in

a housing accommodating the valve assembly.

Attorney Docket No. 037068.55856US

23. (Previously Presented) The pressure regulator module according to

Claim 21, wherein the only one additional solenoid control valve is arranged

outside a housing accommodating the remaining valve assembly consisting of the

two relay valves, and the assigned solenoid control valves, and is constructed to

be connectable to this valve assembly.

24. (Previously Presented) The pressure regulator module according to

Claim 13, wherein center axes of the two relay valves are arranged coaxially and

horizontally in the module.

25. (Currently Amended) The pressure regulator module according to

Claim 14, wherein an acceleration sensor is provided for detecting a lateral

acceleration, which sensor is integrated in the electronic controlling and

regulating unit.

26. (Currently Amended) A pressure regulator module for a pneumatic

braking system of a utility motor vehicle, the pressure regulator module

comprising:

a two-way valve assembly having two conduits, a first conduit including a

first relay valve and only one first pressure regulating valve in the form of a 3/2-

Page 6 of 14

way valve, which 3/2-way valve is assigned to a control input of the first relay

valve, and a second conduit including a second relay valve and only one second

pressure regulating valve in the form of a 3/2-way valve assigned to a control

input of the second relay valve; and

wherein the first and second pressure regulating valves, together with

only one additional pressure regulating valve coupled with an input side of the

first and second pressure regulating valves, connect a control input of the

respective first and second relay valves with a bleeding system, a control

pressure, or a compressed-air reservoir;

wherein the inserted solenoid control valve connects the control input of

the respective relay valve with the compressed air reservoir for adapting the

speed of rotation of a driven wheel, which initially slips during acceleration, to

the speed of rotation of a non-slipping wheel, and the solenoid control valve

assigned to a slipping wheel is controlled in a timed manner depending on the

slip rate of the slipping wheel and a change in velocity of said slipping wheel,

whereby the solenoid control valve assigned to the slipping wheel is alternatively

switched back and forth between a pressure buildup position and a pressure

reduction position.
